TECHNICAL WRITER · KNOWLEDGE BASE & DOCUMENTATION · UX/UI DEVELOPER

Documentation that matches the screen it describes.

I'm Nicholas Walline, UX/UI developer and technical writer at **Blac Flag, LLC** (Moorpark, CA — remote). I write product and process documentation *and* design the interfaces it describes — so guides, SOPs, and knowledge-base articles show users exactly what they see on screen.

I documented the Community Benefit Programs portal (**cbprograms.org**) and contributed its UX/UI design and software development. Portal writing samples are withheld under the client's NDA; equivalent documentation from other projects is available on request. Software developer since 2025, on top of 10+ years of hands-on technical experience in hardware and live production.

Fit for This Contract

Mapped directly to the role's responsibilities — with the project evidence to back each one.

Tickets → KB articles

Resolved engineering changes turned into step-by-step knowledge-base articles for service-desk and content-manager audiences.

`Evidence: module inventory & session handoff docs, marketing platform`

SOPs, runbooks, as-built docs

As-built records maintained as engineers change systems: handoff logs, spacing standards (MD + PDF), verification reports.

`Evidence: handoff records, spacing guide, verification reports`

Exit-readiness (§12)

Documentation inventories and baselines that let an owner hand the system to another vendor at any time.

`Evidence: module inventory, Konekt technical design doc`

Review & retire stale articles

Monthly-style validation cadence: manual verification guides, admin summaries, and retired/superseded doc archives.

`Evidence: manual verification guides, admin verification summaries`

Transition inventory & baseline

Built documentation inventories from scratch for transitioning systems — the exact first deliverable of a transition.

`Evidence: E-ink documentation set, Vincore docs suite`

Writing Samples & Documentation Projects

Docs-as-code: versioned Markdown shipped with the codebase, plus PDF deliverables where the audience needs them. Each entry describes what the documentation actually contains.

Corporate Marketing Platform — As-Built Documentation

React/TypeScript · As-built docs · KB for content managers

The module inventory specs every reusable carousel, accordion, and vertical scroller — editable fields, image requirements, and maximum usage per page — so non-technical content managers can build pages safely. The spacing guide reduces the entire site to six numbers and two section types. Handoff records log each session's completed work, files touched, and exact styling values used.

`Live page shown in the Work section below`

GEQ Gizmo — Field Test & Analysis Reports

Field reports · Test verification · Plain-English analysis

Five formal No-Load Vibration Capture Reports from an onsite motor test day — one per unit under test (Ward Leonard ×2, GEQ Drillmax604, GE 5GEB22D4, Hitachi IEC 60349-2) — each with unit identification, instrumentation details, and pass/fail verification tables covering recording integrity, sample-rate lock, sensor bias, idle floor, and signal-to-floor ratio. Paired with a plain-English FFT report for non-engineer stakeholders, a timestamped factory test log, and a BLE connection troubleshooting writeup.

`Reports shown in the Work section below`

Community Benefit Programs Portal (cbprograms.org)

Government portal · NDA · UX/UI + docs

Knowledge-base articles, SOPs, and user-facing help content for a public benefits portal — plus its UX/UI design and software development. Writing samples withheld under client NDA; structure and process available on request.

`Blac Flag, LLC — client under NDA`

Vincore — Open-Source Documentation Maintainer

Open source · Localization ×6 · Governance

The contributing guide sets the quality bar for new ECU detection families — "fewer maps that are right rather than more maps that are almost right" — and maps the repository layout for new contributors. Fork notes itemize every change versus upstream (branding, app identifier, updater disabled) with trademark attribution preserved.

`Maintained in English, French, German, Spanish, Italian, Portuguese`

MCP Coding Server — Tool Documentation

Developer tools | Install/config guides

The install guide walks from prerequisites (Node 18+, TypeScript, optional g++/CMake/Docker) through step-by-step setup. The README documents 31 developer tools across code execution, linting, testing, Git operations, Docker, deployment, and security scanning.

`Install guide · configuration guide · worked examples`

Obsidion Agent — Installation & Onboarding Docs

End-user docs | Prerequisites & setup

Quick-install from VSIX in four numbered steps with the keyboard shortcut (Ctrl+Shift+K) and agent-server startup commands. The README states requirements first — VS Code 1.85+, Ollama, Python 3.10+ — before setup begins.

`Install guide · README with prerequisites`

Job Automation Suite — SOPs & Troubleshooting

SOPs | Troubleshooting | Workaround analysis

The troubleshooting guide diagnoses why Indeed blocks automated access (Cloudflare 403 protection) and documents the working replacement: three Adzuna API searches returning 100–130+ jobs per run at no cost. The workflow overview lists the ten-plus job boards covered and why the API approach avoids anti-bot detection.

`Setup SOP · troubleshooting guide · workflow overview`

E-Ink Display — Technical Documentation

Hardware | Integration tutorial

A step-by-step Raspberry Pi integration tutorial synthesized from the manufacturer's datasheet, schematic, and outline drawing — turning raw engineering source material into a procedure a builder can follow.

`Tutorial written from ER-EPD037 datasheet + schematic set`

Support Operations Runbooks

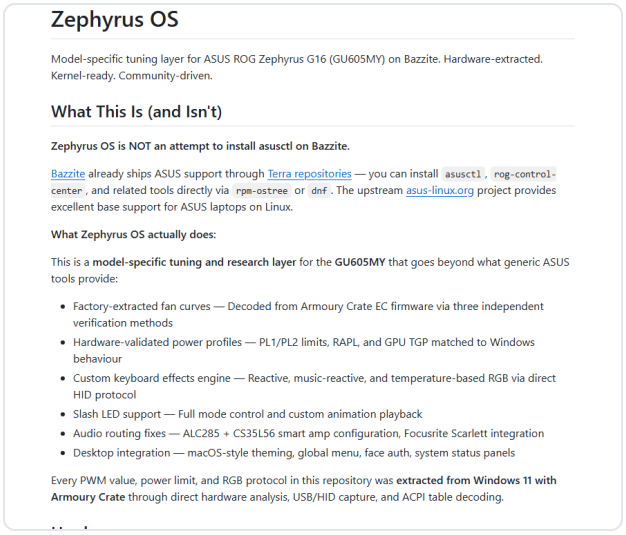

Runbooks | Data-collection SOPs

The data-collection guide is an 18-tool reference table — RW-Everything, GPU-Z, USBPcap, Wireshark, HWiNFO64, powercfg and more — mapping each tool to its purpose and captured output. The fan-curve methodology explains why the firmware tables are inaccessible (encrypted AES-256 config, empty ACPI limits) and documents the empirical capture strategy that replaced them.

`Tool reference table · empirical capture methodology`

Open Source — Public Writing on GitHub

READMEs are documentation too: public, versioned, and written to be read. Each repository below is live on GitHub.

ZephyrusOS

Model-specific tuning layer for the ASUS ROG Zephyrus G16, built from hardware-extracted data — README states what the project is (and isn't) and links every claim to its source.

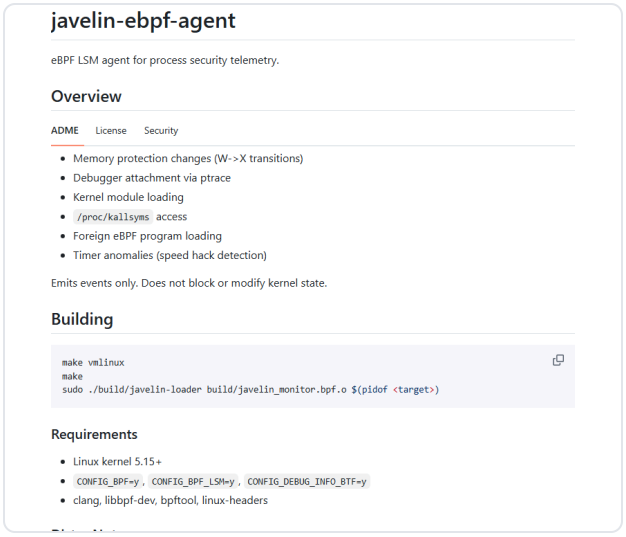

`Rust · README as project documentation`

javelin-linux

Experimental Linux compatibility layer — README documents the userland shim, eBPF LSM agent, and attestation service architecture for a specialized audience.

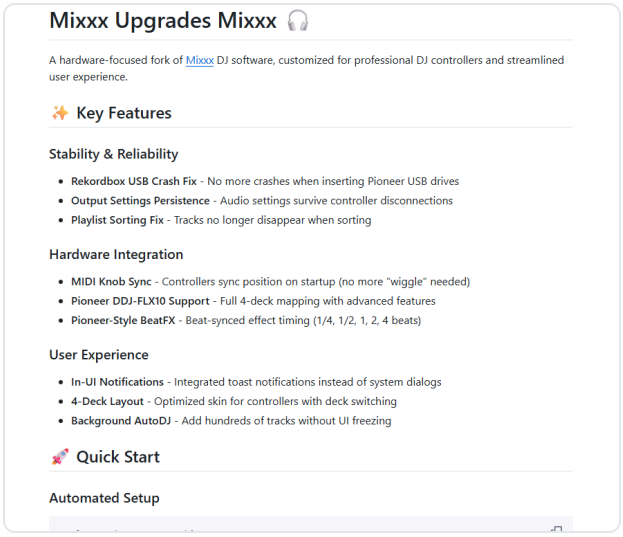

`C · Architecture documentation`

javelin-ebpf-agent

eBPF LSM agent for process security telemetry — README enumerates every monitored kernel event, with emission-only semantics stated plainly up front.

`C · Reference documentation`

Mixxx-Upgrades

Hardware-focused fork of Mixxx DJ software — README organizes crash fixes and controller integrations as user-facing feature documentation.

`C++ · User-facing docs`

The Work

Real, shipped interfaces at full width — not thumbnails. Click any image to open it full-screen; click again inside the viewer for 100% actual pixels. Captured live from the current build (November 2026).

Synchronous Motors

Over 95 Years of Proven Synchronous Expertise

IDEAL Electric synchronous motors deliver precise speed control, high efficiency, and improved power factor, engineered specifically for long-term reliability in critical applications.

01 **IDEAL Electric — Synchronous Motors**

Hero + title sections · React/TypeScript + Payload CMS marketing platform · current build captured live from the dev server

Typical Specifications

Rotor Design

IDEAL motors feature high-quality rotor construction, including solid-forged rotors for high-inertia and demanding synchronous applications, and laminated rotors optimized for electrical efficiency and specialized performance. Each design ensures stability, reliability, and minimized vibration.

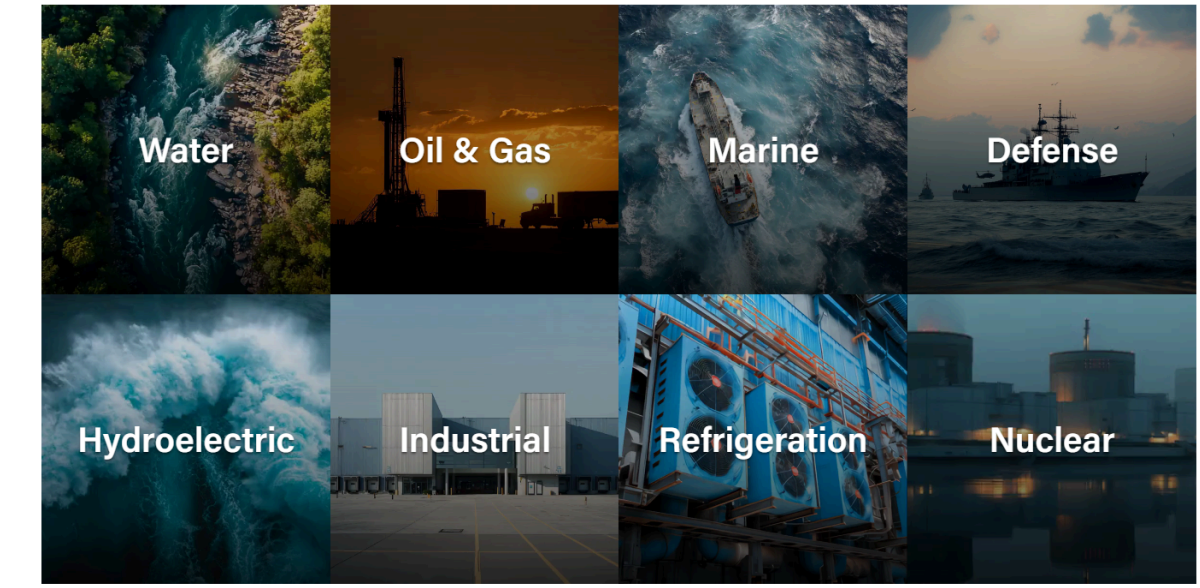

LEARN MORE >>

Why Synchronous Outperforms Induction

01 Efficiency		
	Higher efficiency, significantly lower lifetime operating costs	Lower initial costs, higher lifetime operating expenses
02 Maintenance		
	Low maintenance, decades of proven reliability	Frequent maintenance, replacements, downtime
03 VFD		
	Optimized performance with or without VFDs	Often requires costly VFD systems for effective control
04 Power Factor		
	Unity or leading power factor, better efficiency and lower energy costs	Lagging power factor, lower efficiency, higher energy use

04 Technology deep-dive + comparison

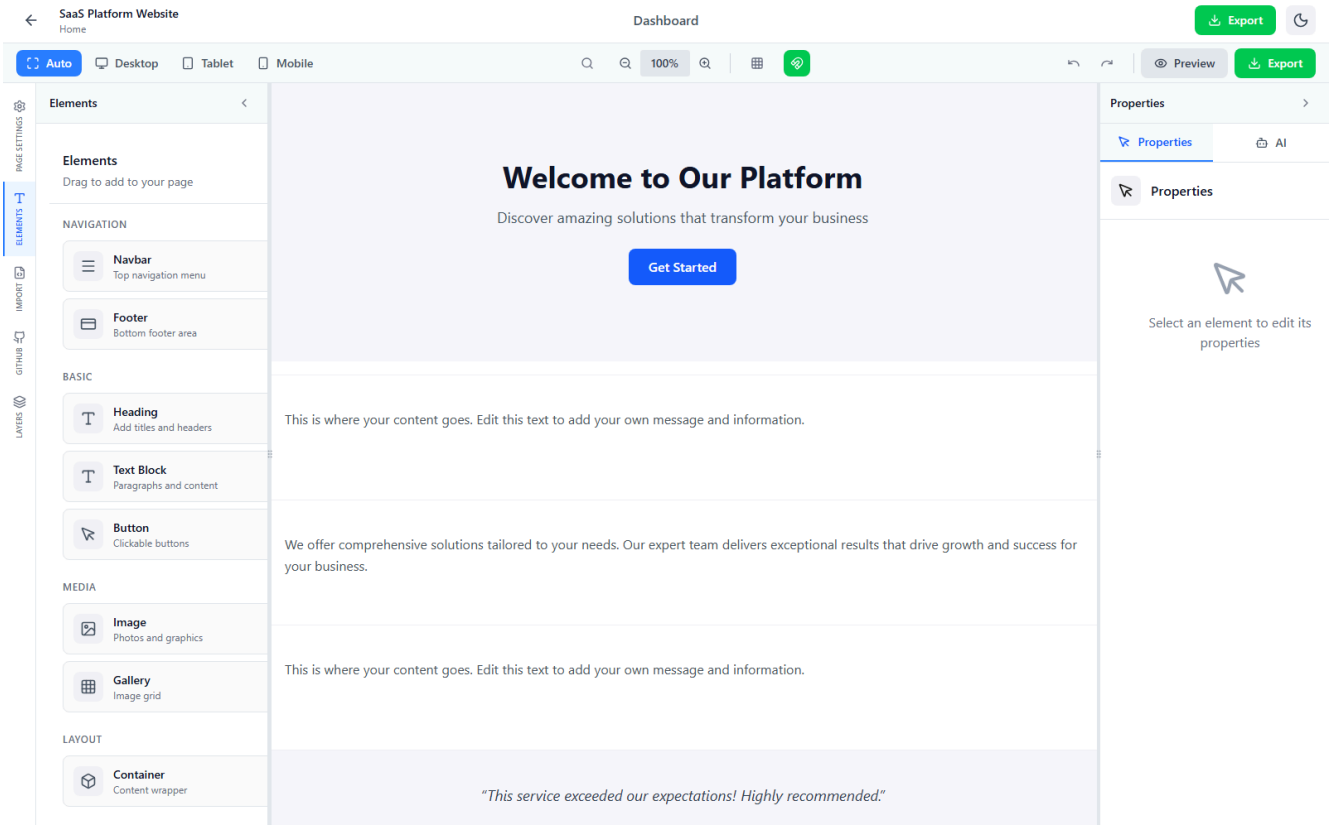

Rotor Design editorial content, the four-part Why Synchronous Outperforms Induction comparison, and the Industries We Serve grid with per-industry photography

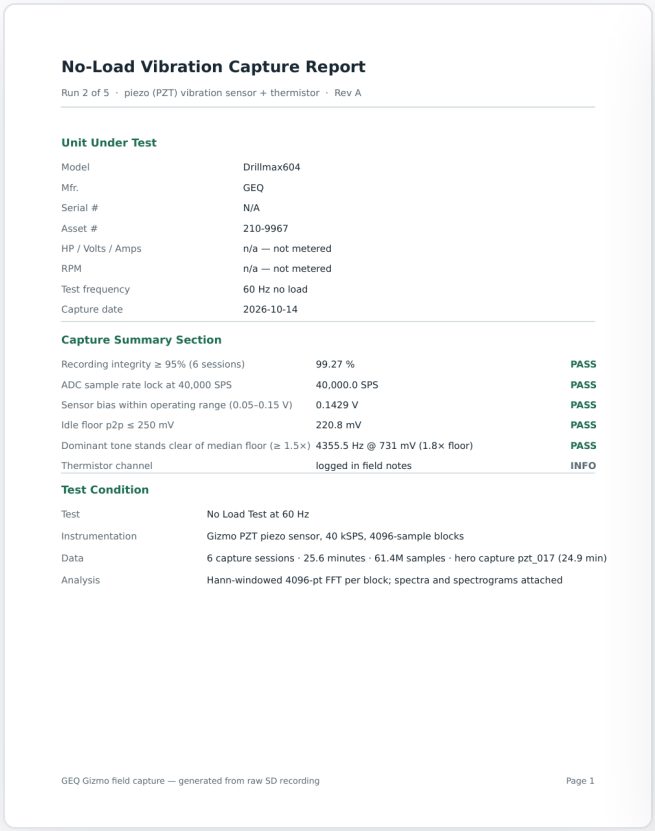

05 Industries grid + CTA panels

Industries We Serve (Water, Oil & Gas, Marine, Defense, Hydroelectric, Industrial, Refrigeration, Nuclear) and the Exact-Fit Replacements / Engineering & Testing panels — full sections, exactly as shipped

Wireframe editor — drag-and-drop canvas with an elements palette (navbar, hero, buttons, galleries), live properties panel, device-preview toggle, and Git-backed export · React 19, TypeScript, Vite, Tailwind CSS 4

No-Load Vibration Capture Report

Run 2 of 5 · piezo (PZT) vibration sensor + thermistor · Rev A

Unit Under Test

Model	Drillmax604
Mfr.	GEQ
Serial #	N/A
Asset #	210-9967
HP / Volts / Amps	n/a — not metered
RPM	n/a — not metered
Test frequency	60 Hz no load
Capture date	2026-10-14

Capture Summary Section

Recording integrity ≥ 95% (6 sessions)	99.27 %	PASS
ADC sample rate lock at 40,000 SPS	40,000.0 SPS	PASS
Sensor bias within operating range (0.05–0.15 V)	0.1429 V	PASS
Idle floor p2p ≤ 250 mV	220.8 mV	PASS
Dominant tone stands clear of median floor (≥ 1.5×)	4355.5 Hz @ 731 mV (1.8× floor)	PASS
Thermistor channel	logged in field notes	INFO

Test Condition

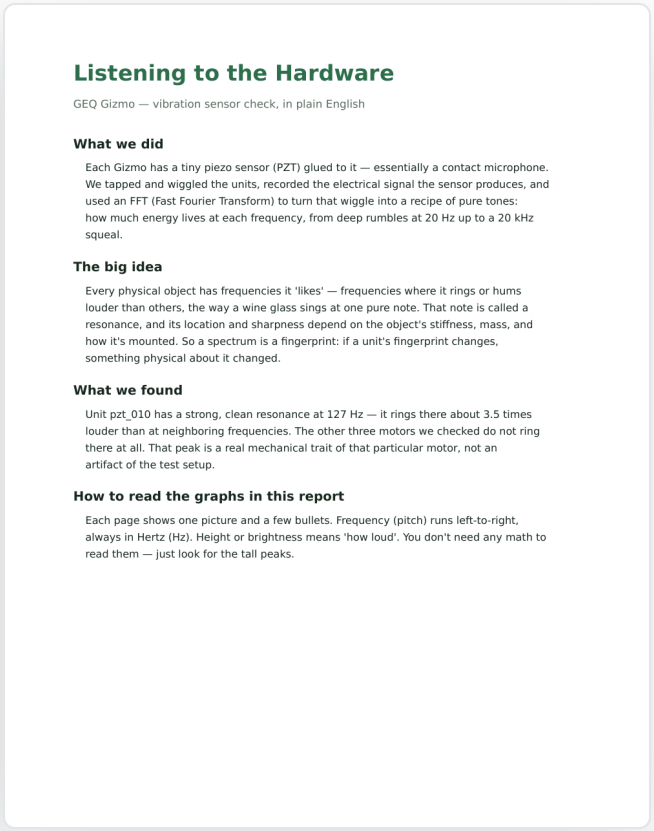

Test	No Load Test at 60 Hz
Instrumentation	Gizmo PZT piezo sensor, 40 kSPS, 4096-sample blocks
Data	6 capture sessions · 25.6 minutes · 61.4M samples · hero capture pzt_017 (24.9 min)
Analysis	Hann-windowed 4096-pt FFT per block; spectra and spectrograms attached

GEQ Gizmo field capture — generated from raw SD recording

Page 1

07 No-Load Vibration Capture Report

Run 2 of 5 — GEQ Drillmax604 · compiled from 61.4M raw samples recorded onsite, October 14 2026 · pass/fail verification table — 5 PASS, 1 INFO

Listening to the Hardware

GEQ Gizmo — vibration sensor check, in plain English

What we did

Each Gizmo has a tiny piezo sensor (PZT) glued to it — essentially a contact microphone. We tapped and wiggled the units, recorded the electrical signal the sensor produces, and used an FFT (Fast Fourier Transform) to turn that wiggle into a recipe of pure tones: how much energy lives at each frequency, from deep rumbles at 20 Hz up to a 20 kHz squeal.

The big idea

Every physical object has frequencies it 'likes' — frequencies where it rings or hums louder than others, the way a wine glass sings at one pure note. That note is called a resonance, and its location and sharpness depend on the object's stiffness, mass, and how it's mounted. So a spectrum is a fingerprint: if a unit's fingerprint changes, something physical about it changed.

What we found

Unit pzt_010 has a strong, clean resonance at 127 Hz — it rings there about 3.5 times louder than at neighboring frequencies. The other three motors we checked do not ring there at all. That peak is a real mechanical trait of that particular motor, not an artifact of the test setup.

How to read the graphs in this report

Each page shows one picture and a few bullets. Frequency (pitch) runs left-to-right, always in Hertz (Hz). Height or brightness means 'how loud'. You don't need any math to read them — just look for the tall peaks.

08 "Listening to the Hardware" — plain-English FFT report

13-page stakeholder report written from the same field data — what we did, the big idea, what we found (a 127 Hz resonance unique to one unit), how to read the graphs

UX/UI & Front-End Work

The other half of the job: designing and building the interfaces the documentation describes.

Community Benefit Programs Portal

UX/UI design and software development for a community benefit programs portal serving the public. *(Blac Flag — NDA.)*

Corporate Marketing Platform

React/TypeScript front-end with a reusable component library — every component spec'd in the module inventory for content managers. Full sections shown in the Work section above.

Blac Harbor

Blac Flag product application — drag-and-drop website builder with AI generation and Git version control. React 19, TypeScript, Vite, Tailwind CSS 4. Wireframe editor shown above.

Hydroelectric Engine Monitoring System

Sensor circuit design, CAD-modeled and 3D-printed enclosures, React-based interfaces, and AI-powered search tools — hardware and software documented as one system.

Product UI Across Contexts

Interface design and front-end development for a billing app, beat store, mechanic CRM, and retail kiosk — web and kiosk form factors. Includes the **Feedback Overlay for Sites**, one of the first projects built after starting development in 2025 (within the first few months).

Stack

React / TypeScript · HTML / CSS / JavaScript · Tailwind · Vite · Server-side configuration · Docker · Git / GitHub · Confluence / Jira · SharePoint · Markdown / docs-as-code

Resume

Nicholas Walline

Technical Writer / Knowledge Base & Documentation Specialist

UX/UI Developer and Technical Writer — Blac Flag, LLC

Moorpark, CA · Remote · (661) 607-1489 · nickw1992@icloud.com · linkedin.com/in/nick-walline-04274b92

> UX/UI developer and technical writer at Blac Flag. Writes product and process documentation and designs the interfaces it describes, so guides match what users actually see on screen. Documented the Community Benefit Programs portal (cbprograms.org) and contributed its UX/UI design and software development. Software developer since 2025, building on 10+ years of hands-on technical experience in hardware and live production. U.S. Person — ITAR/EAR eligible.

Core Competencies

- Knowledge-base articles, SOPs, runbooks, user guides, as-built & process documentation
- Documentation inventory, baselining, and exit-readiness (§12-style transition docs)
- Content lifecycle: review, validation, and retirement of stale articles

- UX/UI design & front-end development: React, TypeScript, HTML, CSS, JavaScript
- Docs-as-code: Markdown, Git, versioned documentation shipped with the codebase

Experience

Blac Flag, LLC (blacflag.io) — UX/UI Developer & Technical Writer
Jan 2025 – Present

- Documented the Community Benefit Programs portal (cbprograms.org): knowledge-base articles, SOPs, and user-facing help for a public government benefits application; contributed UX/UI design and software development. *(Writing samples withheld under client NDA.)*
- Author and maintain as-built documentation for a corporate marketing platform: session handoff records, a reusable-module inventory for content managers, a typographic spacing standard (Markdown + PDF), and verification/admin reports — supporting transition to another vendor at any time.
- Write runbooks and data-collection SOPs for technical operations, converting one-off engineering work into repeatable, transferable procedures.
- Author field test reports for electromechanical field devices (GEQ Gizmo onsite motor test day): formal no-load vibration capture reports with pass/fail verification criteria per unit under test, a plain-English FFT analysis report for non-engineer stakeholders, and a timestamped factory test log.
- Maintain installation and configuration documentation for developer tools: READMEs, install guides, troubleshooting, and workaround analyses for third-party platform restrictions.
- Maintain open-source documentation — user guide, contributing guidelines, fork/trademark attribution, and roadmaps localized in six languages.
- Develop React-based interfaces and AI-powered search tools for hardware-focused applications; began software development in 2025 and have shipped web applications, developer tools, and documentation continuously since.

ROE Visual — Technical Support Supervisor
Nov 2024 – 2026

- Led technical support operations for high-value LED display systems; developed technician workflows and troubleshooting procedures and managed technical documentation, improving refurbishment consistency.
- Managed equipment procurement, inventory tracking, and process documentation to meet production timelines and quality standards.

Liminal Space / Colors Worldwide — LED Repair Technician
Mar 2024 – 2026

- Precision microelectronics repair on professional LED systems: component-level diagnostics, SMD replacement, board rework; configured large-format systems (Brompton Tessera, Novastar).
- Troubleshot signal routing, power distribution, and live-event hardware failures; documented repair procedures for consistency across locations.

SOS Entertainment — AV Technician / Audio Engineer
Sep 2021 – 2026

- Installed and maintained LED video walls, audio, and live production equipment; managed signal routing, power, livestream and broadcast workflows; programmed DMX lighting systems.

Stephan Marks — Electrical Technician
Sep 2020 – Mar 2021

- Developed custom electronic solutions; designed CAD models and fabricated prototypes via CNC/3D printing; iterated through testing and validation to final approval.

Mac Pro LA — Lead Repair Technician
Jan 2020 – Mar 2021

- Advanced diagnostics and component-level Apple hardware repair: teardowns, logic board repairs, display replacements, thermal servicing.

Audio Repair Specialists — Keyboard Technician

Jan 2018 – Mar 2019

- Repaired synthesizers, keyboards, and pro audio electronics; diagnosed analog and digital circuitry; provided technical support and repair recommendations.

Skills

Documentation: knowledge-base articles, SOPs, runbooks, user guides, process & system documentation, documentation inventory, content review/retirement · **UX/UI & Front-end:** interface design, React, TypeScript, HTML, CSS, JavaScript, Tailwind, Vite, server-side configuration, Docker, AI-powered search · **Tools:** Confluence, Jira, SharePoint, Git/GitHub, Markdown, VS Code · **Hardware context:** PCB assembly & rework, CAD, 3D printing, embedded systems, test equipment

Education & Eligibility

College of the Canyons — Associate Coursework · Valencia High School — Diploma · U.S. Person Status — ITAR/EAR Eligible

Contact

Available for the Technical Writer / Knowledge Base & Documentation role. Writing samples, documentation inventories, and references available on request.
